

S3 Web Host: Deploying Static Sites on AWS

Step 1: Create an S3 Bucket

- Sign in to the AWS Management Console.
- Navigate to the Amazon S3 console.
- Click on Create bucket.
- Provide a bucket name that is unique and DNS compliant.
- Select the region closest to your target audience for reduced latency.
- Uncheck Block all public access to allow public access to the website.

Step 2: Enable Static Website Hosting

- Select the newly created bucket.
- Go to the Properties section.
- Find the Static website hosting option and enable it.
- Specify the index document (usually index.html).
- Optionally, set an error document (like error.html).

Step 3: Upload Website Files

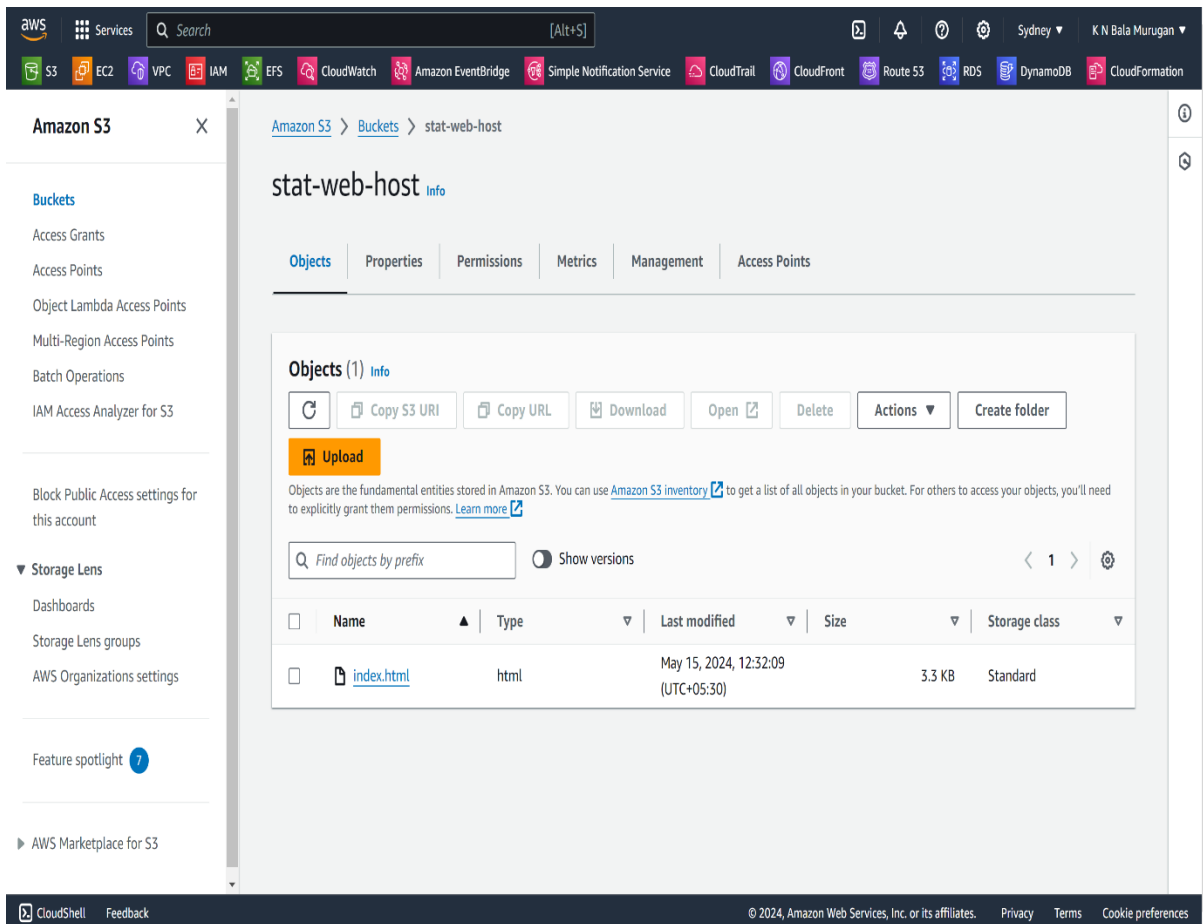

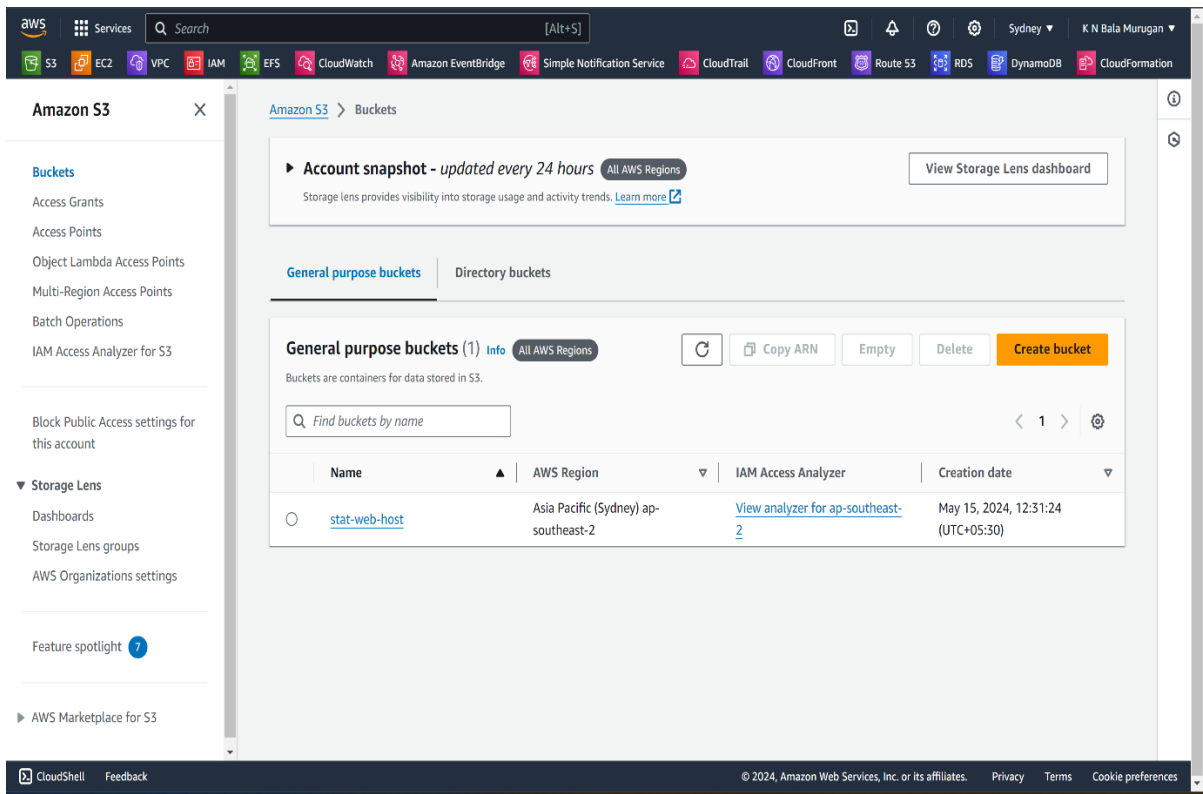

- Go to the Objects tab in your bucket.
- Click on Upload and add your website files (HTML, CSS, JS, images, etc.).
- Set the permissions to make the files publicly accessible.

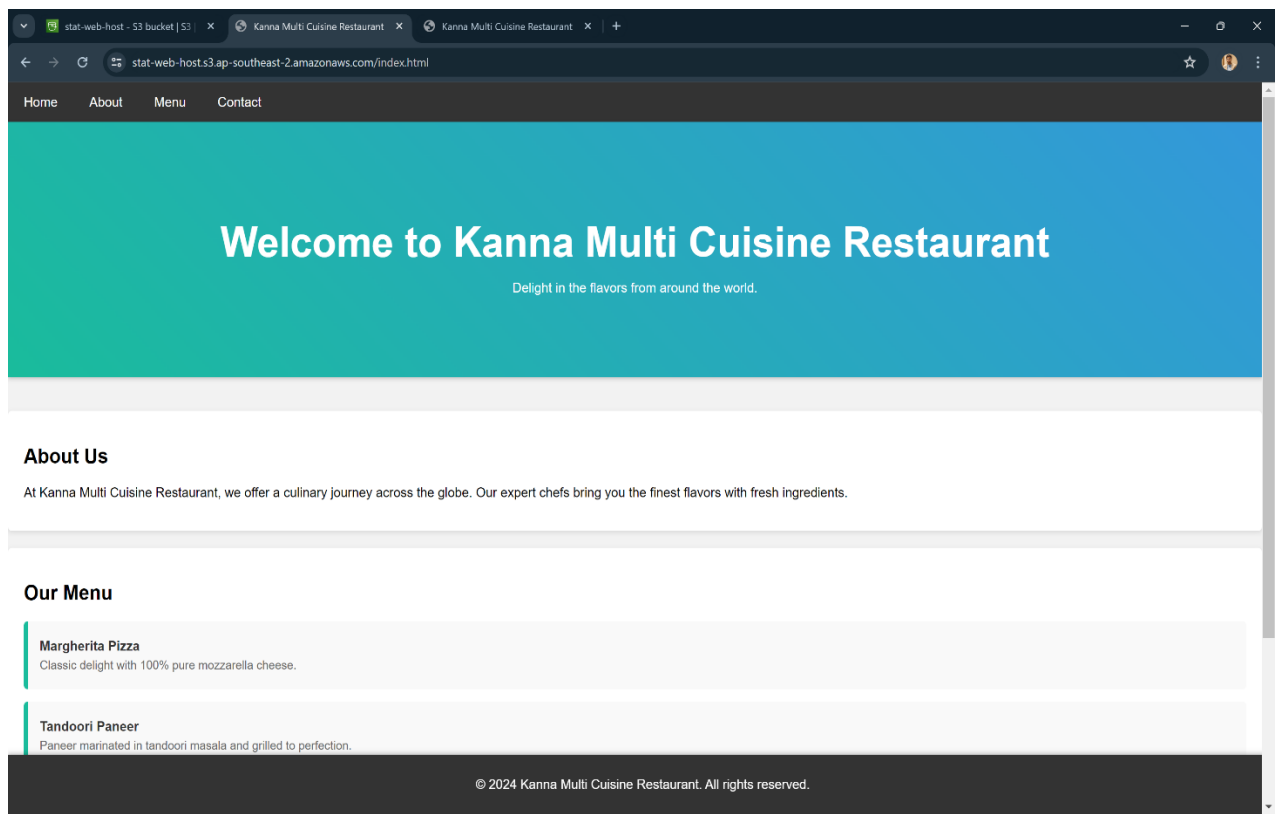

Step 4: Set Bucket Policy

- Navigate to the Permissions tab of your bucket.
- Edit the Bucket policy to grant public read access to the website files.

Step 5: Access Your Website

- After uploading the files and setting the correct permissions, your website should be live.
- You can access it via the endpoint provided in the Static website hosting section of your bucket's properties.

CONCLUSION

- Engineered a scalable static website hosting** on Amazon S3, focusing on cost-efficiency and ease of content delivery with high uptime.
- Established public read access** through precise S3 bucket policies, ensuring secure content distribution without compromising on data privacy.
- Optimized website performance** by utilizing S3's built-in capabilities for web hosting, resulting in a responsive user experience with minimal maintenance.
